

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (currently amended) A method for assigning channels for radio transmission between a subscriber station and a base station of a radio communications system, comprising:
assigning a ~~number~~ plurality of channel resources to ~~[[the]]one~~ subscriber station for one transmission direction via a common channel description transmitted to the subscriber station, the channel resources in each having at least one of different spread-spectrum codes, different code groups, different frequencies and different midambles; and
the channel description includes information about utilization of the channel resources during the radio transmission, which specifies ~~[[the]]~~ an order of the transmission of data for the one transmission direction.
2. (currently amended) The method as claimed in claim 1, in which ~~[[the]]~~ an order of the utilization of the channel resources is specified by the order of the information on each of the plurality of channel resources within the channel description.
3. (previously presented) The method as claimed in claim 2, in which the order of the utilization of the channel resources is specified by information relating to at least one of timeslots assigned, to spread-spectrum codes and to assigned frequencies.
4. (previously presented) The method as claimed in claim 1, further comprising: sending a coherent channel description as a message from the base station to the subscriber station, wherein an uplink channel and a downlink channel are described one after the other.
5. (previously presented) The method as claimed in claim 1, further comprising:
sending an uplink channel and a downlink channel as separate messages from the base station to the subscriber station.

6. (previously presented) The method as claimed in claim 1, further comprising:
sending an uplink channel and a downlink channel in a common channel description as a message, a flag indicating parts of the description which relate to the uplink channel and to the downlink channel.
7. (previously presented) The method as claimed in claim 1 wherein in a case where one channel is changed, the description of this channel is sent.
8. (currently amended) A base station for a radio communications system comprising:
a facility to assign channels for a radio transmission with ~~[[a]]~~ one subscriber station for one transmission direction, wherein
the facility transmits a common channel description to the subscriber station for assigning a ~~number~~ plurality of channel resources for the radio transmission, the channel resources having at least one of different spread-spectrum codes, different code groups, different frequencies and different midambles, and
the facility generates the channel description ~~includes~~ to include information about utilization of the channel resources during the radio transmission, which specifies ~~[[the]]~~ an order of transmission of data for the one transmission direction.
